

Patent Information

Innovative Sampling Solutions, Inc. (ISSI) has spent in excess of one year designing and developing the unique M2 Multimold Cassette. The corporation has enlisted the services of several highly recognized intellectual property attorney firms. All consideration was given and all analysis was done of all existing patents for competitive and like products in the marketplace. It was based on this analysis that Innovative Sampling Solutions made the decision to move forward with a full Research and Development program to develop the M2.

As a result, members of the corporation with extensive experience in patent filing and intricate technical product design and development, worked closely with the attorneys to develop the ISSI's, M2 Multimold patents. Both design and utility patents have been filed with the U.S. Patent Office. The utility patent is extensive and involved, centered around not only product design but methodology, both of which incorporate unique qualities of the M2 Multimold Collection Device.

The patents not only involve the current design, but extensions thereof that will be introduced based on future development revolving around the unique characteristics of the M2 Multimold Cassette.

It is with a great deal of confidence that the corporation anticipates, extensive patent issuance in the future regarding the M2 Multimold Cassette.

As a user or reseller of the M2 Multimold Cassette, you can feel confident that you are using a unique device the design of which will not be compromised, and as a reseller you can feel assured that promotional and sales efforts that you undertake will not be undermined by copies. It is ISSI's charter to support these patents and protect them to the fullest extent of intellectual property law.
